

Meeting Nov 5, 2021

From: Jim Nguyen & Jared Giampietro

Today, we finished gathering all our initial data, converted that into a csv, and pushed them into our database using python and pandas.

Now we just need to create at least 20 diverse sql queries that also include inserting new data, modifying existing data, and deleting data.

For inserting new data, we should input Ahri, Doran Items, Control Ward, Teemo, add old item

For modifying data, we can modify some datas to act as patch changes, can also modify what champion get what role

For deleting data, we can delete teemo, also delete that old item
